Online voting system

- We need to develop the web application for voting process where it should contain candidate page , admin page and result page.where the candidate can cast vote by using OTP that received their registered phones.
- In the candidate page I.e in the home page we need to login to cast the vote if we are already registered.
- If not registered we need to register to cat the vote while registering we need to fill all the details asked in the register form like name,age ,voter id number, adhaar number, we need to upload the photo ,enter the mobile number.
- After registering we can now login to the website using voter id number after entering the voter id we will get the OTP to the registered number so we can now protect the candidate by voting multiple times, once the OTP is entered it goes to the voting ballet page where can cast the vote according to our wish.
- Again the admin will be having all the access to the web page where he will be maintaining the database page and it should be confidential.
- Finally admin will be declaring the result according to the votes casted by the candidates.
